ASSESSMENT Mini Assessment — Prompt Workflow Design

01 | Concept

Purpose: AI Personal Study Planner converts a student's exam date, syllabus topics, available daily study hours, subject difficulty and personal goals into a personalized, week-by-week study schedule.

Problem: Students often struggle to decide how many hours to give each subject, which topics to prioritize, and how to balance revision with practice before an exam. A structured AI workflow turns scattered exam information into a clear, actionable study plan.

02 | Objective

The workflow uses sequential prompts to understand a student's exam situation, prioritize subjects and topics, allocate available study time, plan revision and practice, and review progress. Each stage uses relevant information produced by earlier stages.

03 | Workflow Overview

INPUT	1 Understand	2 Prioritize	3 Allocate	4 Practice	5 Review	OUTPUT

04 | Workflow Steps

1. Exam & Syllabus Analysis — Build a study profile from exam date, syllabus topics, daily available hours and goals. **Output:** Study profile + workload overview

2. Topic Prioritization — Classify topics as high, medium and low priority using difficulty and weightage. **Output:** Prioritized topic list

3. Time Allocation — Distribute available study hours across subjects within the days remaining, including a buffer day. **Output:** Weekly study schedule

4. Revision & Practice Planning — Recommend revision techniques and practice tests matching each subject's priority. **Output:** Revision and practice plan

5. Progress Review — Compare actual study hours with the plan and adapt next week's schedule. **Output:** Updated study plan

05 | Prompt Workflow

Step 1 — Understand the Exam Situation
Analyze the student's exam date, syllabus topics, daily available study hours and current confidence level per subject. Organize the information into a concise study profile. Identify missing information without inventing details.

Step 2 — Prioritize Topics
Using the study profile, classify topics as high, medium and low priority, considering difficulty and exam weightage. Rank subjects from highest to lowest priority and briefly explain the reason for each ranking.

Step 3 — Build the Study Schedule
Create a realistic week-by-week study schedule using the prioritized topics. Respect the student's total available hours. Include focused study blocks, revision time and a buffer day. Avoid unrealistic overloading. Present the plan subject by subject.

Step 4 — Generate Revision & Practice Plan
For the priority topics identified, generate simple revision techniques and practice test suggestions at suitable frequencies. Include a short explanation of expected benefit and difficulty level, and focus on achievable near-term milestones.

Step 5 — Review and Adapt
Review the student's actual study hours against the planned schedule. Identify subjects on track, topics falling behind, unmet revision targets and upcoming priorities. Adjust next week's schedule while keeping it realistic. Clearly explain what changed and why.

06 | Prompt Chaining

Step 1 produces the study profile; Step 2 uses it to prioritize topics; Step 3 uses those priorities to build the schedule; Step 4 uses the schedule to plan revision and practice; and Step 5 uses actual study data to revise the next week's schedule.

STAGE	INPUT / CONTEXT	OUTPUT
1	Exam date + syllabus + hours	Study profile
2	Step 1 profile	Prioritized topic list
3	Step 2 priorities	Weekly study schedule
4	Step 3 schedule	Revision and practice plan
5	Actual study data + earlier context	Updated study plan

07 | Demonstration Input

Example: Exam in 21 days, subjects are Mathematics, Physics, Chemistry and English, 4 hours of study time available per day, weakest subject is Physics, and the goal is to score above 85% overall.

08 | Expected Final Output

A personalized weekly study schedule, prioritized topics, revision targets, a buffer day, a simple practice-test suggestion, progress indicators and recommendations for adjusting next week's plan. The result should be practical, balanced and easy to follow.

09 | Workflow Result & Evaluation

The completed workflow transforms scattered exam information into a structured study strategy. Its final result is a connected planning cycle that can respond to changing study progress.

INPUT	AI PROCESS	FINAL RESULT
Exam date • Syllabus topics • Daily hours • Confidence level • Goal score	Analyze → Prioritize → Allocate → Practice	Personalized schedule • Prioritized topics • Revision plan • Progress adjustments → Review

10 | Sample Final Study Plan

SUBJECT	ALLOCATION	ACTIVITY	OUTPUT
Physics	10 hrs/week	Focused concept study	Weak-topic mastery check
Mathematics	8 hrs/week	Problem-set practice	Practice test score
Chemistry	6 hrs/week	Formula & reaction revision	Revision checklist
English	3 hrs/week	Reading & writing practice	Mock answer review
Buffer / Revision	1 day/week	Catch-up & full revision	Weekly progress summary

11 | Key Benefits

- Personalized scheduling based on exam date and goals
- Priority-driven allocation of study time
- Integrated revision and practice-test planning
- Progress-aware schedule adjustment
- Clear, reusable prompt structure
- No coding required for the workflow design

12 | Conclusion

AI Personal Study Planner demonstrates how prompt engineering can break a complex exam-preparation task into connected, measurable stages. By combining analysis, prioritization, allocation, revision planning and review, the workflow produces a practical study strategy that can be refined as study progress changes.
